4.2.4 Analytical Techniques

				<p>* This was a challenging problem-solving question, relying on candidates to make use of all of the information provided to determine the structure. Very few candidates made no attempt at all at this question.</p> <p>The most common error was incorrectly identifying the peak at 3000 cm^{-1} as O-H from a carboxylic acid, despite it being indicated on the data sheet that this would be a broad peak. It suggested that candidates were not familiar with looking at spectra and understanding what data it gave. Candidates should also be reminded when answering these types of question that they should give the structures, not just molecular formulae, where possible.</p>
			Total	6

4.2.4 Analytical Techniques

Use curly arrow criteria in guidance above

Examiner's Comments

As with 25(a)(i), this question rewarded the well-prepared candidate. The large number of proposed mechanisms showed little resemblance to the accepted mechanism for nucleophilic substitution. Mechanisms were often seen showing curly arrows going in the wrong direction and between the wrong bonds and atoms, charges and dipoles were often incorrect, and partial charges used where full charges were required.

Two exemplars are shown. The first exemplar shows clear curly arrows, the role of the lone pair and all charges correct. The second exemplar shows a typical muddled response. Although the curly arrow from the hydroxide ion has been accurately drawn, the hydroxide ion has a partial charge rather than a - charge. There is also no curly arrow showing breaking of the C-Br bond. The only mark available is for the correct organic product and a Br⁻ ion.

Some mechanisms were so poor that it was impossible to credit many candidates with any marks. Writing mechanisms is an important skill in organic chemistry and it is recommended that candidates learn and practice their writing.

Exemplar 7

(b) An alcohol can be prepared by hydrolysing the haloalkane C₂H₅CHBrCH₃ with sodium hydroxide.

(i) Outline the mechanism for this reaction.

Show curly arrows and relevant dipoles.

Exemplar 8

4.2.4 Analytical Techniques

correct molecular formula

There is a line of reasoning presented with some structure. The information presented is relevant and supported by some evidence.

Level 1 (1–2 marks)

The correct empirical formula

AND a simple description based on at least one of the main scientific points.

OR

The candidate explains one scientific point thoroughly with few omissions.

There is an attempt at a logical structure with a line of reasoning.

The information is in the most part relevant.

0 marks No response or no response worthy of credit.

(aldehyde/ketone/carbonyl group)

- molar mass = 70 g mol^{-1}
(mass spectrum molecular ion peak $m/z = 70$)
- molecular formula = $\text{C}_4\text{H}_6\text{O}$

Functional groups, structure and stereochemistry

- alkene / $\text{C}=\text{C}$
- aldehyde / $-\text{CHO}$ (C_3H_5^+ fragment)
- mass spectrum; peak at 41 due to C_3H_5^+ (loss of CHO)
- *E/Z* or *cis-trans* isomer: *E/Z* or *cis-trans* isomer:

Examiner's Comments

This question was a good discriminator. Most candidates were able to deduce the empirical formula and the $\text{C}=\text{O}$ peak on the IR spectrum. However, many mistook the $\text{C}-\text{H}$ peaks around 3000 cm^{-1} for an alcohol $\text{O}-\text{H}$ peak or assumed from the empirical formula that it was an alcohol so made the spectra 'fit' their hypothesis. At AS, the exposure of candidates to IR and spectra is not as comprehensive as in the second year of A Level and this was evident. There was very little annotation of the spectra and candidates should be encouraged to do this as it is helpful to them in their deductions (and to the examiners for crediting marks). Analysis of the IR spectrum was much more detailed than the mass spectrum. Most candidates just referred to the molecular ion peak and made no attempt, or an incorrect attempt, at discerning the peak at 41. Those that did quickly realised what the structure was and gained 5 or 6 marks. Some candidates, despite ascertaining that a *trans* stereoisomer should be drawn,

draw the *cis* version instead.

Exemplar 5

In the mass spectrum, the peak with the greatest relative intensity is caused by the loss of a functional group from the molecular ion of compound F.

Determine the structure of compound F.

Explain your reasoning and show your working.

$$\begin{array}{r} \text{C} \quad \text{H} \quad \text{O} \\ 68.6 \quad 8.6 \quad 22.8 \\ \hline 12 \quad 1 \quad 16 \\ \hline = 5.716 : 8.6 : 1.425 \\ \hline = 4.011 : 6.03 : 1 \end{array}$$

Empirical formula of compound F is $\text{C}_4\text{H}_6\text{O}$.

The M^+ peak in the mass spectrum has an m/z value of 70, so the molecular mass of compound F is 70 g mol^{-1} .

So the molecular formula of compound F is $\text{C}_4\text{H}_6\text{O}$.

The infrared spectrum shows an absorbance peak in the range $1630\text{--}1820 \text{ cm}^{-1}$, indicating the presence of a $\text{C}=\text{O}$ band.

There is no absorbance peak in the range $2500\text{--}3300 \text{ cm}^{-1}$, so there is no O-H bond, so compound F is not a carboxylic acid.

Compound F is not a carboxylic acid. The mass spectrum shows a fragmentation peak at 41 m/z , indicating the presence of a CH_2CH^+ fragment from the loss of a CHO functional group.

Compound F is an aldehyde. It is a *trans* stereoisomer, so the hydrogens attached to the carbons on the double bond are opposite each other.

This candidate has very logically worked through all the information provided and has come up with the correct structure from the deductions.

Exemplar 6

Explain your reasoning and show your working.

$$\begin{array}{r} \text{C} \quad \text{H} \quad \text{O} \\ 68.6 \quad 8.6 \quad 22.8 \\ \hline 12 \quad 1 \quad 16 \end{array}$$

$$= 5.716 : 8.6 : 1.425$$

$$= 4.0 : 6.0 : 1$$

$$\text{empirical formula} = \text{C}_4\text{H}_6\text{O}$$

$$\text{Mr} : (12 \times 4) + (6 \times 1) + (16) = 70$$

$$\text{F Mr} = 70 \Rightarrow \text{molecular formula} = \text{C}_4\text{H}_6\text{O}$$

Peak at $29 \Rightarrow \text{CHO}$
Peak at $41 \Rightarrow \text{CH}_2\text{CH}^+$

IR Spectrum \Rightarrow Peak at $1630\text{--}1820 \text{ cm}^{-1}$ indicates the presence of a $\text{C}=\text{O}$ group
 \Rightarrow Peak at $1620 \Rightarrow 1680 \text{ cm}^{-1}$ indicates the presence of a $\text{C}=\text{C}$ group.

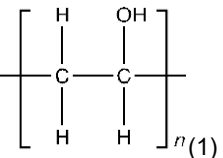

Like most candidates, the crucial information about F being a *trans* isomer was not picked up so they draw the double bond in the wrong place.

4.2.4 Analytical Techniques

				 <p>IGNORE name of carboxylic acid if structure given</p> <p>Examiner's Comments</p> <p>The final question on the paper was a six mark level of response question which required candidates to identify a molecule from a range of data. Most candidates were able to process the percentage composition data to arrive at an empirical formula but less able candidates then failed to use the data from the mass spectrum to arrive at the molecular formula. Candidates were generally able to use the infrared spectrum to identify the presence of –OH and C=O and could link this to the carboxyl functional group. The best candidates were able to identify the peak in the mass spectrum at 43 and to link this to a C₃H₇⁺ fragment which led to the assumption that the carboxylic acid was butanoic acid. Many outstanding candidates were able to discuss the peak at 43 being that of a branched chain secondary carbocation and linked this to the correct branched product. Some answers were unstructured and disorganised and candidates should be encouraged when analysing data to organise their answer sequentially and discuss each piece of data in turn.</p>

4.2.4 Analytical Techniques

		<p>OR skeletal formula OR mixture of the above in equation</p> <p>Examiner's Comments</p> <p>This question allowed candidates to demonstrate their knowledge and problem solving skills to tie together all the evidence provided. It was common to see candidates identify the ranges of the characteristic peaks for a carboxylic acid in the IR spectrum but a significant proportion did not identify the relevant bond that each peak referred to. Many candidates interpreted the flowchart given at the start of the question to comment on the presence of an alcohol group in L, and using their molecular formula from part (a), deduced structures for both L and M. The strongest candidates were also able to provide a correctly balanced equation for the formation of M. The most common incorrect structure for L was 1,3-dihydroxypropanone, however, error carried forward marks were awarded to candidates who provided the corresponding dicarboxylic acid as the oxidation product M.</p>
<p>c</p>	<p>Monomer N: (1 mark)</p>  <p>Polymer P: (1 mark) Section showing at least one repeat unit of a polymer formed from N with side links ✓ e.g.</p>	<p>For ALL structures: ALLOW correct structural OR skeletal OR displayed formula OR mixture of the above</p> <p>IGNORE names</p> <p>ALLOW 1 mark for either</p>  <p>AS ECF from L:</p>  <p>.....</p> <p>For P: ALLOW ECF from an alkene with molecular formula C₃H₄O₂</p> <p>ALLOW one or more repeat units but has to have a whole number of repeat</p>

4.2.4 Analytical Techniques

		 <p>Repeat units (1 mark) $n = 10000/72 = 139 \checkmark$</p> <p>Equation (1 mark)</p> <p>Balanced equation for formation of P from N ✓ e.g.</p> 	<p>units</p> <p>ALLOW repeat unit with no brackets and absence of n</p> <p>MUST be a whole number. QWC: No carboxylic acid OH absorption in IR **OR** no peak between 2500–3300 cm⁻¹

AND

so **J** is a secondary alcohol **OR** so **K** is a ketone ✓

Alcohol J

Compound K

Structure of a carbonyl compound that could be obtained from alcohol **J** ✓

Equation

Balanced equation for conversion of **J** to **K** ✓

e.g.

ALLOW ranges from *Data Sheet*, i.e. C=O within range 1640–1750 cm⁻¹;

IGNORE any reference to C-O absorption For structures of **J** and **K**, **ALLOW** correct structural **OR** displayed **OR** skeletal formula **OR** mixture of the above

IGNORE any names given for **J** and **K**

ALLOW 1 mark for the structure of an alcohol with the molecular formula C₅H₁₂O

DO NOT ALLOW pentan-1-ol (*primary and unbranched*) or 2-methylbutan-2-ol (*branched but tertiary*)

DO NOT ALLOW any marks for **J** and **K** if more than one structure is given for **J**

Note: 'sticks' in either **J** and / or **K** will lose only 1 mark

ALLOW 1 mark for:

IF a structure is not given for **J**

NOTE: structures for **J** and **K** could be awarded from the equation, even if not labelled.

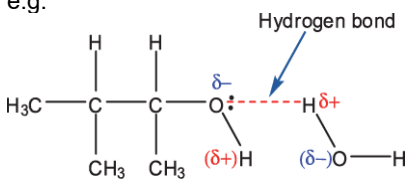

ALLOW molecular formulae in equation i.e. C₅H₁₂O + [O] → C₅H₁₀O + H₂O

DO NOT ALLOW equations that form a carboxylic acid

Examiner's Comments

This question discriminated well and most candidates were able to score at least one mark, by identifying the C=O peak in the IR spectrum provided. The most able candidates gave succinct responses that included both the correct structures of **J** and **K** as well as a balanced equation. In addition, they included reference to the absence of a carboxylic acid O-H peak in the IR spectrum concluding that **K** must be a ketone. This marking point was missed by a large proportion of the cohort and often a branched primary alcohol for **J** and corresponding aldehyde for **K** were

4.2.4 Analytical Techniques

				<p>suggested. Some candidates incorrectly identified the C—H peak in the spectrum as an O—H and suggested that K was a carboxylic acid.</p>
	b	<p>Labelled diagram showing at least one H-bond between alcohol molecule and water ✓</p> <p>e.g.</p> 	1	<p>IF diagram is not labelled ALLOW Hydrogen bonds / H bonds from text</p> <p>Diagram should include role of an O lone pair and dipole charges on each end of H bond.</p> <p>IGNORE alcohol R group, even if wrong</p> <p>ALLOW structural OR displayed OR skeletal formula OR mixture of the above</p> <p>Examiner's Comments</p> <p>The majority of candidates were able to draw a diagram to show the hydrogen bond between an alcohol and water. However, a significant proportion lacked the accuracy required at this level and failed to show the role of the lone pair. It was also common to see responses that omitted the relevant dipoles. The question asked for the inclusion of relevant dipoles and lone pairs and candidates are advised to double check diagrams to ensure these key features are not neglected.</p>

ALLOW wavenumber range up to 2400–3500 cm^{-1}

ALLOW structural, skeletal or displayed formula.

DO NOT ALLOW ECF from incorrect molecular formula

Examiner's Comments

This question allowed the candidates to demonstrate their understanding of the more complex aspects of the course and use their problem-solving skills to tie together the all of the evidence.

The calculation of the empirical formula was completed well and most candidates were able to determine the molecular formula of **G**.

Many of the more able candidates were able to identify one, if not both, of the ions responsible for peaks **X** and **Y** in the mass spectrum. A number of candidates were able to show correct fragments but omitted the positive charge. Candidates should be reminded to include the correct charge when suggesting particles responsible for peaks in mass spectra.

The majority of candidates were able to recognise the characteristic absorptions in the IR spectrum. The strongest responses attributed these peaks to the appropriate bonds and deduced that **G** was a carboxylic acid.

Two marks were available for the structure of **G**. The most able candidates were able to interpret all the information and provide the correct branched carboxylic acid. Some candidates recognised that the number of hydrogen atoms present suggested the presence of a carbon- carbon double bond, but suggested a straight

4.2.4 Analytical Techniques

				chain compound. Other candidates provided a cyclic carboxylic acid. These two approaches were awarded one mark. The most common incorrect structure seen for G was butanoic acid.
