Combinations of Random Variables

Questions

Q1.

Sugar is packed into medium bags and large bags. The weights of the medium bags of sugar are normally distributed with mean 520 grams and standard deviation 10 grams. The weights of the large bags of sugar are normally distributed with mean 1510 grams and standard deviation 20 grams.

(a) Find the probability that a randomly chosen large bag of sugar weighs at least 15 grams more than the combined weight of 3 randomly chosen medium bags of sugar.

(6)

(b) Find the probability that a randomly chosen large bag of sugar weighs less than 3 times the weight of a randomly chosen medium bag of sugar.

(5)

A random sample of 5 medium bags of sugar is taken.

(c) Find the value of d so that the probability that all 5 bags of sugar each weigh more than 520 grams is equal to the probability that the mean weight of the 5 bags of sugar is more than d grams.

Q2.

A manufacturer makes two versions of a toy. One version is made out of wood and the other is made out of plastic.

The weights, W kg, of the wooden toys are normally distributed with mean 2.5 kg and standard deviation 0.7 kg. The weights, X kg, of the plastic toys are normally distributed with mean 1.27 kg and standard deviation 0.4 kg. The random variables W and X are independent.

(a) Find the probability that the weight of a randomly chosen wooden toy is more than double the weight of a randomly chosen plastic toy.

(6)

The manufacturer packs n of these wooden toys and 2n of these plastic toys into the same container. The maximum weight the container can hold is 252 kg.

The probability of the contents of this container being overweight is 0.2119 to 4 decimal places.

(b) Calculate the value of *n*.

(8) (Total for question = 14 marks) Q3.

The weights of a particular type of apple, *A* grams, and a particular type of orange, *R* grams, each follow independent normal distributions.

(a) Find the distribution of

(i) *A* + *R*

(ii) the total weight of 2 randomly selected apples.

A box contains 4 apples and 1 orange only. Jesse selects 2 pieces of fruit at random from the box.

(b) Find the probability that the total weight of the 2 pieces of fruit exceeds 310 grams.

From a large number of apples and oranges, Celeste selects m apples and 1 orange at random. The random variable W is given by

$$W = \left(\sum_{i=1}^{m} A_i\right) - n \times R$$

where *n* is a positive integer.

Given that the middle 95% of the distribution of W lies between 1100.08 and 1499.92 grams,

(c) find the value of m and the value of n

(8)

(3)

(Total for question = 14 marks)

Q4.

The random variable $X \sim N(5, 0.4^2)$ and the random variable $Y \sim N(8, 0.1^2)$

X and Y are independent random variables.

A random sample of a independent observations is taken from the distribution of X and one observation is taken from the distribution of Y

The random variable $W = X_1 + X_2 + X_3 + ... + X_a + bY$ and has the distribution N(169, 2²)

Find the value of a and the value of b

(Total for question = 6 marks)

Q5.

The random variable X has probability density function f(x) and Figure 1 shows a sketch of f(x) where

$$f(x) = \begin{cases} k(1 - \cos x) & 0 \le x \le 2\pi \\ 0 & \text{otherwise} \end{cases}$$

(a) Show that $k = \frac{1}{2\pi}$

The random variable $Y \sim N(\mu, \sigma^2)$ and E(Y) = E(X)

The probability density function of Y is g(y), where

$$g(y) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{y-\mu}{\sigma}\right)^2} \qquad -\infty < y < \infty$$

Given that $g(\mu) = f(\mu)$

(b) find the exact value of σ

(3)
(c) Calculate the error in using
$$P\left(\frac{\pi}{2} < Y < \frac{3\pi}{2}\right)$$
 as an approximation to $P\left(\frac{\pi}{2} < X < \frac{3\pi}{2}\right)$ (4)

(Total for question = 10 marks)

(3)

Q6.

Scaffolding poles come in two sizes, long and short. The length *L* of a long pole has the normal distribution N(19.6, 0.6^2). The length *S* of a short pole has the normal distribution N(4.8, 0.3^2). The random variables *L* and *S* are independent.

A long pole and a short pole are selected at random.

(a) Find the probability that the length of the long pole is more than 4 times the length of the short pole. Show your working clearly.

Four short poles are selected at random and placed end to end in a row. The random variable T represents the length of the row.

(b) Find the distribution of *T*.

(c) Find P(|L - T| < 0.2)

Notes:

(a) M1: selecting and using an appropriate model. ie $\pm (W - 2X)$ May be implied by -0.04 A1: -0.04 oe

M1: for realising the need to use Var(W) + 4 Var(X). Allow use of 0.7 for Var (W) instead of 0.7² and/or 0.4 for Var(X) instead of 0.4². May be implied by 1.13

A1: 1.13 only

M1: For realising the P(T > 0) is required and an attempt to find it. $\frac{0 - \text{"their} - 0.04"}{\sqrt{\text{"their} 1.13"}}$ may be

implied by a correct answer. If E(T) and Var(T) have not been given they must be correct here A1: awrt 0.484/0.485

(b)M1: Selecting and using appropriate model. May be implied by 0.81 B1: 5.04n only

A1: 0.81n

M1: For standardising using their mean and sd $\pm \frac{252 - "5.04n"}{\sqrt{"0.81n"}}$ If mean and sd not given they must

be correct here

M1: For constructing an equation and equate their standardisation to 0.8 or awrt 0.7998. Must be of form $\frac{252 - an}{b\sqrt{n}} = 0.8$ or $\frac{252 - an}{bn} = 0.8$

M1: Correctly solving their 3 term quadratic equation. Condone n = 7

M1: for realising the need to square their answer or for attempting to square their quadratic equation A1cso: 49 only
