

Q1.Figure 1 shows the stages in the transmission of the malaria parasite by mosquitoes to humans.

(a) Where in the mosquito does **Stage 2** happen?

Draw a ring around the correct answer.

brain salivary glands stomach

(1)

(b) What is **Organ A** in the human?

Draw a ring around the correct answer.

liver pancreas small intestine

(1)

(c) What happens in the human at **Stages 5** and **6**?

(d) Sickle-cell anaemia is an inherited disease caused by a mutation in the haemoglobin gene.

(i) Genes are small pieces of DNA. The DNA in a gene consists of a sequence of bases.

Figure 2 shows part of the base sequence in the DNA of a normal haemoglobin gene and the same section in the sickle-cell gene. **A, C, G** and **T** represent the different bases.

Figure 2

Normal gene	GGACTCCTC
Sickle-cell gene	GGACACCTC

Describe how the mutation causes a change in the shape of the haemoglobin protein molecule.

(4)

- (ii) Sickle-cell anaemia is caused by a recessive allele, **a**. The normal haemoglobin allele is dominant, **A**.

Use a genetic diagram to find the probability that two heterozygous parents will produce a child who is homozygous for sickle-cell anaemia.

Probability =

(4)

(iii) What is the benefit of the heterozygous genotype in areas where malaria is common?

.....
.....

Q2. DNA is the genetic material of human cells.

Figure 1 shows the structure of part of a DNA molecule.

(a) (i) Describe where DNA is found in a human cell.

.....
.....
.....

(2)

(ii) When a cell divides by mitosis the new cells are genetically identical. What causes the cells to be genetically identical?

.....

.....

(1)

(b) Many genes have different forms called alleles.

- (i) A person has polydactyly (extra fingers or toes). Polydactyly is caused by a dominant allele.
What is the smallest number of copies of the dominant allele for polydactyly that could be found in a body cell of this person?

.....

(1)

- (ii) Another person has cystic fibrosis. Cystic fibrosis (CF) is caused by a recessive allele.
How many copies of the recessive CF allele are there in a body cell of this person?

.....

(1)

(c) A burglar broke into a house. The burglar cut his hand on some broken glass. Scientists extracted DNA from the blood on the broken glass.

The scientists analysed the DNA from the glass and DNA from three suspects, **A**, **B** and **C**. The scientists used a method called DNA fingerprinting.

Figure 2 shows the scientists' results.

Which suspect, **A**, **B** or **C**, is most likely to have been the burglar?

Tick (✓) **one** box.

A

B

C

.....

.....

(c) Polydactyly is a genetic disorder that leads to extra fingers or toes.

Polydactyly is caused by a dominant allele, **D**.

The photograph shows the hand of a person with polydactyly.

© Adem Demir/Hemera.

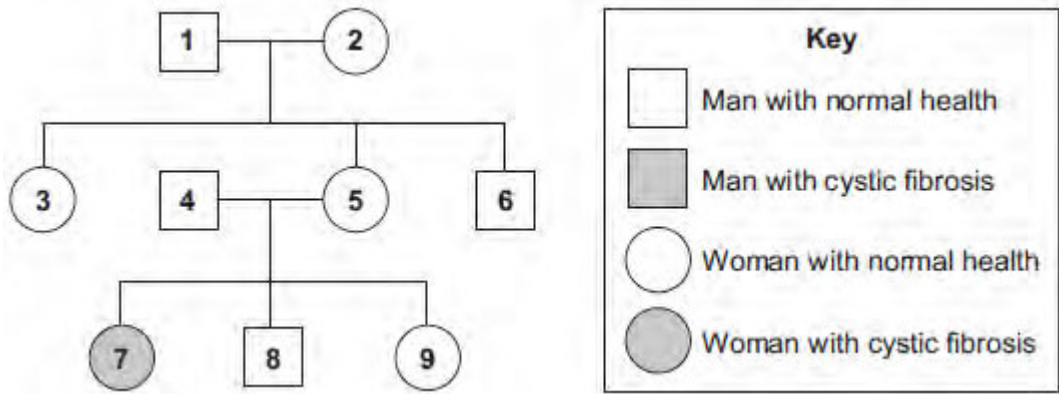

A man has polydactyly. His wife does not have polydactyly.

This couple's children have a 50% chance of having polydactyly.

Draw a genetic diagram to explain why.

- (d) Cystic fibrosis is another genetic disorder. It is caused by a recessive allele.

The diagram shows the inheritance of cystic fibrosis in one family.

Woman 5 is pregnant with her fourth child.

What is the probability that this child will have cystic fibrosis?

Draw a genetic diagram to explain your answer.

Use the following symbols.

N = allele for normal health

n = allele for cystic fibrosis

Q4. The diagram shows part of a DNA molecule.

(a) (i) In which part of an animal cell is DNA found?

.....

(1)

(ii) Complete the following sentence.

The letters **A**, **C**, **G** and **T** in the diagram represent four different compounds called

(1)

(iii) One strand of the DNA, in the section labelled **X**, contains the following sequence of these compounds:

T A T G G G T C T T C G

How many amino acids would this section of the DNA code for?

(1)

- (iv) The section of DNA described in part (a) (iii) is a small part of a gene. The sequence of compounds **A**, **C**, **G** and **T** in the gene is important. Explain why.

.....

.....

(2)

- (b) *Read the following information about genetic engineering.*

The caterpillar of the European Corn Borer moth feeds on the fruits of maize (sweet corn). There is a chemical called Bt-toxin which is poisonous to the corn borer caterpillar but not to humans.

Scientists carried out the following steps.

1. The Scientists made a bacterial plasmid to which they added two genes:
 - **Bt** gene, which coded for production of the Bt-toxin
 - **kan^r** gene, which coded for resistance to an antibiotic called kanamycin.
2. They used this plasmid to produce genetically modified bacteria which could invade plant cells.
3. They mixed these genetically modified bacteria with pieces cut from maize leaves.
4. They placed the pieces of maize leaf on agar jelly in a Petri dish. The agar jelly contained the antibiotic, kanamycin. The kanamycin killed most of the pieces of maize leaf, but a few survived.
5. They took some cells from the surviving pieces of maize leaf and grew them in tissue culture.

The result was maize plants that now contained the **Bt** gene, as well as the **kan^r** gene, in all of their cells.

- (i) What is a **plasmid** (Step 1)?

.....
.....

.....
.....

(2)

(ii) Why did the scientists add **kanamycin** to the agar jelly (Step 4)?

.....
.....
.....
.....

(2)

(iii) The scientists grew each Bt-maize plant from a single cell which contained the **Bt** gene.

Explain why **all** the cells in the Bt-maize plant contained the **Bt** gene.

.....
.....
.....
.....

(2)

(iv) Kanamycin is an antibiotic.

Some scientists are concerned that the gene for kanamycin resistance has been put into maize.

Suggest why.
