

Q1. This question is about metals.

Figure 1 shows the metals used to make pylons and the wires of overhead cables.

(a) An ore contains a metal compound.

A metal is extracted from its ore in three main stages, as shown in Figure 2.

Explain why **Stage 2** needs to be done.

.....

.....

.....

.....

(2)

(b) Cast iron from a blast furnace contains 96% iron and 4% carbon.

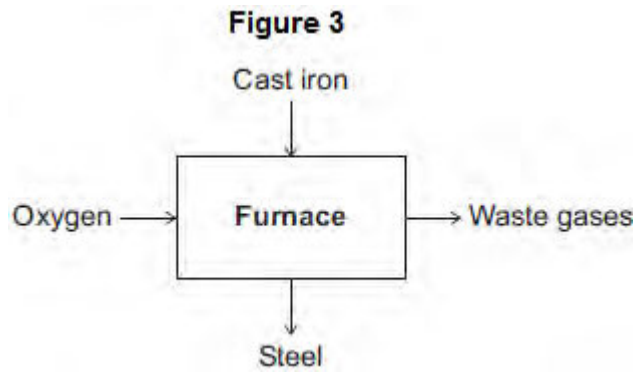

(i) Cast iron is not suitable for the manufacture of pylons.

Give **one** reason why.

.....
.....

(1)

(ii) Most cast iron is converted into steel, as shown in **Figure 3**.

Describe how cast iron is converted into steel.

Use **Figure 3** to help you to answer this question.

.....
.....
.....
.....

(2)

(c) Aluminium and copper are good conductors of electricity.

(i) State **one** property that makes aluminium more suitable than copper for overhead cables.

.....
.....

(1)

(ii) How can you tell that copper is a transition metal and aluminium is **not** a transition metal from the position of each metal in the periodic table?

.....
.....
.....
.....

(2)

(iii) Copper can be extracted from solutions of copper salts by adding iron.
Explain why.

.....

Q2. The extract below was taken from a leaflet on the uses of platinum. One of the uses described was in making electrodes for spark plugs in car engines. The spark plug produces the spark which ignites the fuel in the engine.

Spark Plugs

The electrodes in a spark plug have to conduct electricity very well. Since they project into the combustion chamber of the engine, they must also be able to withstand extremely high temperatures in a very corrosive atmosphere.

Nickel-based plugs have been produced for many years. They only last a fairly short time. As the electrodes wear, combustion becomes less efficient and the petrol is not burnt completely.

Platinum and other precious metals can now be used in spark plugs. These last much longer and are more efficient. This can help to reduce air pollution.

The table below gives some information about platinum and nickel.

	MELTING POINT (° C)	BOILING POINT (° C)	POSITION IN REACTIVITY SERIES	COST (£/kg)
nickel	1455	2920	Higher than gold	2.5
platinum	1769	4107	below gold	6110

(a) Compare nickel and platinum for use in making the electrodes in spark plugs.

A good answer should give advantages and disadvantages of each metal linking these to the properties of the metals. Marks will be given for the way in which you organise your answer.

You will need a sheet of lined paper.

(8)

(b) (i) Describe the structure and bonding in metals.

.....

.....

.....
.....
.....
.....
.....
.....
.....

(3)

(ii) Explain why metals such as nickel and platinum are good conductors of electricity.
